

Bee Ware, the leading provider of Web application security solutions, announces more groundbreaking technology with the advent of Silent Web Application Assessment

Watch. Assess. Measure. These prerequisites pave the way in general to serene decision-making and are particularly appropriate in the application security space, where the diversity of languages and technologies tend to complicate most processes. With the help of the three basics and several years of invaluable experience, Bee Ware has developed a radically new approach to Web application security, referred to as Silent Assessment.

Observation

Applications change all the time and cannot be interrupted at will. A primary feature of Bee Ware's technology is its silence. Observation without interference is applied even to software in production. The result is full process visibility, permanent if need be, but never intrusive with respect to the application and its users.

Assessment

Systematic searching, no matter how precise, quickly comes up against limitations or side effects as the field of investigation widens. Bee Ware uses a contextual approach so that specific criteria determine what scenario to apply to trigger various behaviors and subsequently analyze the results.

Measurement.

Various criteria are used to take stock of an application vulnerability, which can impact technical or business infrastructure or both. Remediation can involve corrective patching, new security rules or a change in process design. Bee Ware's solutions are founded on a knowledge repository that is capable of differentiating between the priorities of security administrators, programmers and senior management.

"We often find that application security issues arise from incomplete knowledge of an application", says Bee Ware Technical Director Philippe Leothaud. "Web security is not just a question of means but is based on the proper understanding of Web applications, of their technological and business dimensions."

Bee Ware's solution i-Watch uses silent Web application assessment to perform application audits in an unintrusive manner. Without affecting the application or its environment in any way the solution identifies resources, highlights vulnerable spots and makes relevant recommendations.

ABOUT BEE WARE

Bee Ware is the leading provider of secure web enabled delivery solutions. Built to Open Standards, Bee Ware's award-winning product lines ensure security, high performance and business continuity for the world's most demanding organisations. Learn more at www.bee-ware.net
